                                                                                                                                                                                                                                                                                                                                                       The present invention describes an expressed sequence tag (EST), where the EST is an isolated, enriched, or purified nucleic acid sequence representing all or part of a gene, the expression of which, or its complementary sequence, in a cell identifies the cell as a developmentally competent or incompetent cell. Molecules which induce developmental competence in a cell line are useful for inducing incompetence in one or more cells. Molecules which induce developmental incompetence in a cell line are useful for preventing a full term pregnancy in an animal and inhibiting totipotence. The molecules are also useful for treating a disease in an animal by inducing development of one or more cells of the animal into a specific cell type. The present the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1960 GAAGCACAAGCTGGAATCAAGATTGCCGGGAGAAATAGCAATAACCTCAGATATGCAGAT 2019

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes bovine DNA sequences (A) which are used in a method to establish a digital, standardized DNA signature. DNA signatures established from (A) are used to monitor breeding; to determine origin of animal products; to identify individual animals; to study genetic association and to establish signatures that are specific at the level of breed, population or race. The method is based on individual base exchanges in DNA, and these are inherited more stably (by an order of magnitude) than conventional markers. It is suitable for population-wide studies (as a high throughput test) and the presence of unequivocal sequences flanking the variable position provides a built-in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2637
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2697
                                                                                                                                                                                                                                                                                                                                                                                                                                                       817
for xenotransplantation into human patients. The invention also relates to an ovine tissue devoid of antibody-detectable Gal-alpha (1,3)Gal (GAL) determinants which are made by alpha(1,3) galactosyltransferase (GT). The ovine tissue is useful for treatment of human body by surgery or therapy and in xenotransplantation, by transplanting the ovine tissue into a mammal having circulating antibody against Gal alpha(1,3)GT determinants. Polymucleotide constructs of the invention are useful for inactivating an alpha1,3 GT gene in an ovine cell. Alpha (1,3)GT sequences are useful for drug screening and for the production of GAL containing synthetic oligosaccharides. Sequences of the invention are also useful in gene therapy. The present sequence is alpha (1,3)GT post-exon 4 DNA
                                                                                                                                                                                                                                                                                                                                                                               877
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  757
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            697

                                                                                                                                                                                                                                                                                                                                      This invention relates to novel isolated bovine 1-80 and Leu-13 proteins whose expression is induced by interferon and elevated during bovine pregnancy. The invention is useful for detecting pregnancy in a bovine animal. The method involves taking biological samples from a test animal and from a non-pregnant animal and detecting bovine 1-80 protein or Leu-13 protein in which an elevation of the protein from the test animal relative to that from non-pregnant animal indicates pregnancy in the test animal. The present sequence is that of the upstream region of the gene which encodes the bovine 1-80 protein and which is related to the

The invention relates to a purified mucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nuclectide sequences, appearing a ransformed call having a nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic of functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and c(2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (detecting the level or pattern of the complementary nucleic acid surface acid sequences or its complementary nucleic acid permits the detection of the molecule; and (detecting the level or pattern of the molecule in a bovine cell or tissue. The detection of the molecule or acid is used for level or pattern of the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the complementary nucleic acid and the complementary nucleic acid and the complementary nucleic acid and the complementary nucleic acid is used for the second or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the complementary control or the complementary control or constructs for use in cattle gene expression, or control or control or control or control or control or control or control or control or control or control or control or control or control or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site: seqdata.uspto.gov/sequence.html?DocID=20020137139

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX4836-ABX49947, or complements of them. Also included are (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic caid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of plyadenylated ribonuclectides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or the detection of the molecule. The LMFD nucleic acid is predictive of the complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid is predictive of the detecting the level or pattern of a molecule in a bovine cell or tissue.

It is useful for genome mapping, gene identification and analysis, cattle of the second molecule in a bovine cell or the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is not of the complementary nucleic acid is not of the complementary nucleic acid is not of the complement of the molecule in a bovine cell or pattern of a molecule in a bovine cell or pattern of a molecule acid sequence is one of the compl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2591

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49347, or complements of them. Also included are if in a transformed cell having a nucleic acid comprising an LMFD nucleic caid linked to a promoter and a 3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and close to proportion of the comprising and complementary nucleic acid sequences or its complement equipment along the complement of the sequence obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for detectining a level or pattern of a molecule acid is predictive of the complementary nucleic acid sequence to reduce mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the correction of the molecule to pattern of expensive tell or tissue. The correction of the molecule construction and analysis, cattle present sequence was not shown in the specification but was obtained in construct for electronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1951 GGGCTGGAAGAAGCAAGCTGGAATCAAGATTGCCGGGAGAAATAGCAATAACCTCAGA 2010

functions in the cell to cause termination of transcription and addition of polyademylated ribnnucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any centre the 15112 bovine Last acid (compression) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the detection of the molecule. The LMPD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle for penetically improving cattle. The present sequence is one of the complementary nucleic acids, Note: The complement LMPD EST (expressed sequence tag) nucleic acids. Note: The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1589 GAACTICCAGIIGIICAAGCIGGIITIIAGAAAAGICAGAGGAACCAGAGACCAAAIIGCC 1648

The invention relates to a purified nucleic acid molecule associated with lactation or mussle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, 1, 1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic caid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of plyddepylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid server or the detection of the molecule in a bovine cell or tissue.

Clevel or pattern of the molecule in a bovine cell or tissue.

It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for greent sequence is one of the laborate sequence the sequence is not of the complement sequence is not of the complement sequence is not of the complement sequence in the complement sequence in the complement of a processed sequence the sequence is not of the complement of the complement sequence is not of the complement of the complement of the complement of the complement of the complement of the complement of the complement of the complement of the complement of the complement of the complement of the complement of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1943 GAAACGCTGGGCTGGAAGAAGCACAAGCTGGAATCAAGATTGCCGGGAGAAATAGCAATA 2002

The invention relates to a purified mucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX14836-ABX49947, or complements of them. Also included are [1] a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of 20 determining a level or pattern of a molecule in a bovine cell or [2] determining a level or pattern of a molecule acid (comprising any complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid, where the detection of the complementary nucleic acid, where the detection of the complementary nucleic acid, where the detection of the complementary nucleic acid, where the detection of the complementary nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for 2360 2300 409 -----CTGACTTTATTTTGGGGGGCTCCAAAATCACTGCAGATGGTAACTGCAGCCA 289 New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle. Bovine, ss; EST; expressed sequence tag; lactation; LWFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding. 350 AAATAGCAGAGACATCACTTTGTCAACAAAGGTCCATCTAGTCAAGGCTATGGTTTTTTC 2243 TGAAATTAAAAGACACTTACTCCTTGGAAGAAAAGTTA--ACCAACCTAGATAGCATATT 2301 GABABGCAGAGACATTACCTTGCCAACAAAGCCCCATCTAGTCAAGGCTATGGTTTTCC Bovine EST associated with lactation/muscle/fat deposition #5347. determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the present sequence is one of the present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:

                                                                                                                                                                                   This invention describes bovine DNA sequences (A) which are used in a method to establish a digital, standardized DNA signature. DNA signatures established from (A) are used to monitor breeding; to determine origin of animal products; to identify individual animals; to study genetic animal products; to identify individual animals; to study genetic association and to establish signatures that are specific at the level of breed, population or race. The method is based on individual base exchanges in DNA, and these are inherited more stably (by an order of studies (as a high throughput test) and the presence of unequivocal sequences flanking the variable position provides a built-in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2669

cattle, and the LMFD nucleic acid can specifically hybridise to a second nuclear, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleicide sequences, appearing as ABX-4886-ABX49947, or complements of them. Also included are included are included acid linked to a promoter and 3' non- translated sequence that cunctions in the cell to cause termination of the mRNA molecule; and cid linked to a promoter and 3' non- translated sequence that the cell to cause termination of the mRNA molecule; and of determining a level or pattern of a molecule in a bovine cell or itsue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule optained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the molecule. The LMPD nucleic acid is used for level or pattern of the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breathing a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breathing apprentation of constructs for use in cattle gene expression, or present sequence as not shown in the specification but was obtained in a partance in and in the partance is none of the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1931 GAGACATCATGAGAAACGCTGGGCTGGAAGAAGCACAAGCTGGAATCAAGATTGCCGGGA 1990

Assay for comparing nucleic acid sequence with a reference, useful for determining prion gene alleles, comprises determining the profile of heteroduplexes.

Claim 2 (i)(a); Fig 1; 36pp; English.

The invention relates to an assay for determining allelic variations in prion protein genes, involving comparing a nucleic acid sequence with a reference. The method is used for determining the PrP allele in an animal (or human) in order to assess susceptibility to transmissible spongiform encephalopathies (TSB), most especially scrapie in sheep. This assists in the selection, for breading, of animals having the alleles known to be associated with lowest risk. The method is reproducible and rapid, provides high resolution between allelic variants and is suitable for sheep PrP gene, that is used in the context of the invention as a comparison nucleic acid

ABV99702

ABV99702 standard; cDNA; 31412 BP.

ABV99702;

(first entry) 12-FEB-2003 Sheep BSE-resistant prion protein cDNA.

Transmissible spongiform encephalopathy; neuroprotective; prion protein; bovine spongiform encephalopathy; transgenic; BSE; bovine; cervid; PrP; ISE; gene; ss; sheep.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           18272 Tharaaractiggiricaaccaacacriricangiriacagacarcaicricigig
                                                                                                                                                                                                                                                                                                            The invention relates to a novel transgenic bovine/cervid comprising a transgene encoding a mutant prion protein (PrP) polypeptide, in which a bubstitution has been made at position 171 of the sequence, which renders the bovine/cervid resistant to bovine spongiform encephalopathy (BSE) and transmissible spongiform encephalopathy (TSE) disease, respectively. The transgene of the invention has neuroprotective activity. The method is useful for producing a transgenic bovine or cervid resistant to BSE and TSE diseases. The bovine prion gene is useful for producing transgenic cattle exhibiting resistance to bovine spongiform encephalopathy. The sequence represents the transgene encoding the mutant PrP polypeptide in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses immunologically compatible animal tissue, suitable for xenotransplantation into human patients. The invention also relates to an ovine tissue devoid of antibody-detectable Gal-alpha (1,3)Gal (GAL) determinants which are made by alpha (1,3) galactosyltransferase (GT). The ovine tissue is useful for treatment of human body by surgery or therapy and in xenotransplantation, by transplanting the ovine tissue into a nammal having circulating antibody against Gal alpha (1,3)GT determinants. Polynucleotide constructs of the invention are useful for inactivating an ablahal, 3 GT sequences are useful for drug screening and for the production of GAL containing synthetic oligosaccharides. Sequences of the invention are also useful in gene therapy. The present sequence is alpha (1,3) GT post-exon 4 DNA
                                                                                                                                                                                                                                                                                                                                               surgery;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New ovine tissue devoid of antibody-detectable Gal-alpha(1,3)Gal
determinants, for xenotransplantation, and in the treatment of the human

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, of 11 a transformed cell having a nucleic acid comprising an LMFD nucleic acid inked to a promoter and a 3' non- translated sequences that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid acquences or its complement or fragment) with a complementary nucleic acid acquences or its complement or fragment) with a complementary nucleic acid acquence of the molecule; and detecting the level or pattern of the detection of the molecule; and (b) detecting the level or pattern of the detection of the molecule; and (complementary nucleic acid permits the detection of the molecule; and (complementary nucleic acid permits the detection of the molecule. The MMPD nucleic acid is predictive of the detection of the molecule. The MMPD nucleic acid is predictive of the molecule. The molecule in a bovine cell or tissue.

The susful for genome mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the list useful for expense a sequence tag) nucleic acid so of the list become the user of shown in the specification but was obtained in electronic format from the USPTO webs site:

Sequence of sequence was not shown in the specification but was obtained in electronic format from the USPTO webs site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2427

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if it is a transformed call having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that the call to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and ccomplementing a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the molecule acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue, the detection of the complementary nucleic acid molecule obtained from the bovine cell or the complementary nucleic acid molecule. The LMFD nucleic acid, where the detection of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the certain properation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence cell or tissue content to the present sequence was not shown in the specification but was obtained in a laborator. New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle. Bovine, SS; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding. This invention describes bovine DNA sequences (A) which are used in a method to establish a digital, standardized DNA signature. DNA signatures established from (A) are used to monitor breading, to determine origin of animal products; to identify individual animals, to study genetic association and to establish signatures that are specific at the level of bread, population or race. The method is based on individual base exchanges in DNA, and these are inherited more stably (by an order of studies in DNA, and these resident its suitable for population-wide studies (as a high throughput test) and the presence of unequivocal sequences flanking the variable position provides a built-in standardization feature

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, appearing a transformed cell having a nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid aliaked to a promoter and a 3 and of the mRNA molecule, and cc of polyadenylated ribonucleotides to a 3 and of the mRNA molecule, and cc (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any cc of the 1512 nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid, where the detection of the complementary nucleic acid is predictive of the detection of the molecule. The LMFD nucleic acid, is used for the detection of the molecule. The LMFD nucleic acid, is used for determining a level or pattern of the molecule. The LMFD nucleic acid, is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle compensation on constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the complement sequence was not shown in the specification but was obtained in a latert not all the inspired in a per sepecification but was obtained in a latert not a latert not an inspired in a per sequence as not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                  New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 423 BP; 93 A; 128 C; 72 G; 130 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                               deposition, useful for genome mapping, gene identific
cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          segdata.uspto.gov/sequence.html?DocID=20020137139

The Intention relates to a purinted muclence acid medicale associated with cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectie sequences, appearing as ABX49947, or complements of them. Also included are included are included to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyademylated ribonucleotides to a 3' non- translated sequence that functions in the cell to cause termination of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) includating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complementary nucleic acid sequences or its complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid sequence or its such as a second of the complementary nucleic acid sequence or its complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is used for detecting in for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the recomplement and analysis, cattle breeding. Devine LMPD EST (expressed sequence tes one of the recomplement and provine and analysis, cattle breader and analysis, cattle breader and manalysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to a purified nucleic acid molecule associated with

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are; (1) a transformed cell havying a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of plyddenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or the detection of the molecule. The Mercentonion of the molecule, and (b) detecting the level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breath or pattern of a molecule in a bovine cell or tissue. The present sequence easi or so of the complement of the molecule of the molecule of the complement of the molecule or pattern of a molecule in a bovine cell or tissue. The breath in a bovine LMFD best cannow mapping, gene identification and analysis, cattle breath in the level or pattern of a molecule in a bovine cell or the complement of the molecule or pattern of a molecule in a bovine cell or the complement of the molecule or pattern of a molecule or pattern of the molecule or pattern of a molecule or pattern of the molecule or pattern of a molecule or pattern of the molecule or pattern of a molecule or pattern of or pattern of a molecule or pattern or pattern or pattern or pattern or p

The invention relates to a purified nucleic acid molecule associated with cattation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, appearing as ABX34936-ABX49947, or complements of them. Also included are cid allocation of a promoter and a 3 non-translated sequence that control or a promoter and a 3 non-translated sequence that control or polyadenylated ribonuclectides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid, swhere the detection of the molecule. The LMFD nucleic acid, is used for complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid, is used for the detection of the molecule. The LMFD nucleic acid, is used for complementary nucleic acid is used for complementary nucleic acid is used for the molecule or a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle complements is present sequence tag not shown in the present sequence is one of the complement requence was not shown in the respecticities of the incomplement in the respective of the complement of the nucleum of the respective of the complement and such shown in the respective of the complement of the nucleum of the respective of the complement of the nucleum of the respective of the complement of the nucleum of the sequence was not shown in the respective of the respective of the respective of the respective of the respec 1748 AAACTGTGGAAATTCTGAAAGGGATGGGAATACCAGACCACCTGACCTGACTCTTGAAA 1807 New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, Bovine; ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) to polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the proteins and polynucleotides may be used to provent, (2) proteins and polynucleotides may be used to provent, (2) proteins and cancer metastases of haematopoietic-derived cells. AAK64703 cancers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK49422 to AAK5450 and AAM82169 represent invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GICAAACAAGAGAIGGCAAGAGIGAAIGICAACAIICIAGGAAICAGCGAAC-IAAAAIG 662

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are ; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or
New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.

tissue comprising: (a) incubating a marker nucleic acid (comprising any coff the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid, where the detection of the complementary nucleic acid; so used for the detecting of the molecule. The LMFD nucleic acid is used for determining a level or pattern of the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle or preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 1512 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence as not shown in the specification but was obtained in electronic format from the USPPO web site:

This invention describes bovine DNA sequences (A) which are used in a method to establish a digital, standardized DNA signature. DNA signatures setablished from (A) are used to monitor breeding; to determine origin of animal products; to identify individual animals; to study genetic association and to establish signatures that are specific at the level of breed, population or race. The method is based on individual base exchanges in DNA, and these are inherited more stably (by an order of magnitude) than conventional markers: It is suitable for population-wide studies (as a high throughput test) and the presence of unequivocal sequences flanking the variable position provides a built-in

ew bovine genomic DNA sequences, useful for establishing genetic ignatures, e.g. for breeding control, contain specific variable

```
New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                     Bovine; ss; EST; expressed sequence tag; lactation; LMFD;
muscle deposition; fat deposition; genome mapping; gene identification;
gene analysis; cattle breeding.
                                                                                                                                                                                                                                                                                                                                                                    Bovine EST associated with lactation/muscle/fat deposition #3391

The invention relates to a purified nucleic acid molecule associated with catcation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising an specifically hybridise to a second appearing as ABX34836-ABX4937, or complements of them. Also included are a promoter and a 3 non-translated sequence that acid linked to a promoter and a 3 non-translated sequence that call to cause termination of transcription and addition of polyadenylated ribbnucleotides to a 3' end of the mRNA molecule; and comprising a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the last or acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the detection of the molecule. The detection of the molecule complementary nucleic acid molecule obtained from the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the molecule. The LMFD nucleic acid, is used for the detection of the molecule. The LMFD nucleic acid, is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle complements proved for molecule in a bovine cell or tissue. The breath sequence was not shown in the sequence is one of the content of the molecule in a powine caids. Note: The present sequence was obtained in a part of the molecule. electronic format from the USPTO web site: seqdata.uspto.gov/sequence.html?DocID=20020137139

The invention relates to a purified mucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non-translated sequence that the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and cf polyadenylated ribonucleotides to a al' end of the mensa any acid tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complementary nucleic acid sequences or its complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid sequences or its complementary nucleic acid molecule obtained from the molecule; and (b) detecting the level or pattern of the complementary nucleic acid so the complementary nucleic acid is used for complementary nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for determining a level or pattern of the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle to genetically improving cattle. The present sequence is one of the complementary nucleic acid is used for the genetically improving cattle. The present sequence is one of the complementary nucleic acid is used for the genetically improving cattle. The present sequence is one of the complementary nucleic acid is used for the genetically improving cattle. The present sequence was not shown in the specification but was obtained in cell cross sequence. The present sequence format from the USPPTO web site:

```
The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are (i) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of plyddepylated Tibonucleotides to a 3 end of the mRNA molecule, and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 1512 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequence be arised for the molecule; and (b) detecting the level or pattern of the complementary nucleic acid sequence to detecting of the molecule obtains a bovine cell or the molecule. The LMFD nucleic acid is predictive of the detection of the molecule. The LMFD nucleic acid is used for the molecule of the molecule in a bovine cell or tissue.

CC level or pattern of the molecule in the molecule acid is used for the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breading, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the lactoric format from the USPTO web site:

CS sequence was not shown in the specification but was obtained in election in a bovine of sequence. The security of the molecule of the present sequence as not shown in the specification but was obtained in a bovine and an analysis of the electronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
Bovine; ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Byatt JC, Mathialagan N, Tao N, Warren WC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 2; SEQ ID NO 11945; 245pp; English.

The patent discloses immunologically compatible animal tissue, suitable for xenotransplantation into human patients. The invention also relates to an ovine tissue devoid of antibody-detectable Gal-alpha (1,3)Gal (GAL) determinants which are made by alpha (1,3) galactosyltransferase (GT). The ovine tissue is useful for treatment of human body by surgery or therapy and in xenotransplantation, by transplanting the ovine tissue into a marmal having circulating antibody against Gal alpha (1,3)G determinants. Polynucleotide constructs of the invention are useful for inactivating an alphal, 3 GT gene in an ovine cell. Alpha (1,3) GT sequences are useful for drug screening and for the production of GAL containing synthetic oligosacoharides. Sequences of the invention are also useful in gene therapy. The present sequence is alpha (1,3) GT post-exon 4 DNA
                                                                                                                                                                                            Sheep; xenotransplantation; Gal-alpha (1,3)Gal; GAL determinant; surgery; alpha(1,3) galactosyltransferase; alpha (1,3) GT; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ovine tissue devoid of antibody-detectable Gal-alpha(1,3)Gal determinants, for xenotransplantation, and in the treatment of the human
                                                                                                                                                     Sheep alpha (1, 3) galactosyltransferase post-exon 4 DNA #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 18; Page 76; 86pp; English.

Sequence 1, Application US/09193562D
Patent No. 630987;
GENERAL INFORMATION:
APPLICANT: Pauli, Benedicht U.
TITLE OF INVENTION: Nucleotide Sequences Encoding Mammalian Calcium
TITLE OF INVENTION: Nucleotide Chloride Channel-Adhesion Molecules
FILE REFERENCE: 18617.0052
CURRENT APPLICATION NUMBER: US/09/193,562D
CURRENT FILING DATE: 1998-11-17
PRIOR APPLICATION NUMBER: US/60/065,922
PRIOR APPLICATION NUMBER: US/60/065,922
PRIOR FILING DATE: 1997-11-17
SEQ ID NO:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         25;

US-10-204-708-80

Sequence 80, Application US/10204708

Patent No. 6677731

GENERAL INFORMATION:

APPLICANT: OLEK, Alexander

APPLICANT: PIEFENBROCK, Christian

APPLICANT: BERLIN, Kurt

TITLE OF INVENTION: Diagnosis of Diseases Associated with DNA Replication

FILE REFERENCE: 5013.1012

CURRENT APPLICATION WUMBER: US/10/204,708

CURRENT FILING DATE: 2003-05-06

PRIOR FILING DATE: 2001-04-06
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TTAAAAAGACTTTAAAATTAATTTCTCTTTAGTGTTTTACCAGTTCTTTCAGGCTAC
